

Amendment to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (currently amended): A system-updating method for updating software installed in a user computer system, said method comprising the steps of:
 - acquiring user computer system information including information on hardware employed in said user computer system and information on said software installed in said user computer system;
 - constructing a test environment for testing operations of said user computer system based on the basis of said acquired user computer system information;
 - updating said software in said test environment by using a software-updating patch;
 - determining whether or not said operations of said user computer system are carried out normally by execution of said updated software in said test environment; and
 - supplying said software-updating patch to said user computer system and using said software-updating patch to update said software installed in said user computer system if said operations of said user computer system are determined to be normal.

2. (currently amended): A system-updating method according to claim 1, wherein said user computer system comprises a means for monitoring said user computer system information and a means for updating said software installed

in said user computer system; and

wherein said user computer system acquires said software-updating patch and uses said software-updating patch to update a piece of said software installed in said user computer system without halting execution of a program included relevant to said piece of software.

3. (original): A system-updating method according to claim 1 wherein said user computer system:

acquires a result of a test conducted to determine whether or not said operations of said user computer system are carried out normally by execution of said updated software in said test environment;

shows said result to a user; and

asks said user a question as to whether or not said software installed in said user computer system is to be updated.

4. (currently amended): A system-updating method for updating software installed in a user computer system as software to be updated by using a software-updating patch received from a vendor computer system, said method comprising the steps of:

transmitting information on said user computer system from said user computer system to said vendor computer system;

selecting a proper software-updating patch in said vendor computer system based on the basis of said information on said user computer system and transmitting said selected proper software-updating patch to said user computer system;

constructing a test environment based on the basis of said software-updating patch received from said vendor computer system;

using said test environment for evaluating said software-updating patch to give a result of evaluation;

using said software-updating patch for updating said software installed in said user computer system if said result of evaluation is good; and

transmitting said result of evaluation to said vendor computer system to prompt said vendor computer system to transmit another software-updating patch if said result of evaluation is bad.

5. (currently amended): A vendor computer system for providing software to a user computer system, said vendor computer system comprising:

a user computer system management unit having a means for receiving information on said user computer system from said user computer system;

a means for constructing a test environment for said user computer system based on the basis of said information on said user computer system and a software-updating patch;

a means for examining said software-updating patch by using said test environment to determine whether or not said software-updating patch is suitable for said user computer system; and

a means for transmitting said software-updating patch determined to be suitable for said user computer system to said user computer system.

6. (original): A vendor computer system according to claim 5, further comprising:

a means for logically dividing a real machine of said vendor computer system into a plurality of logical partitions; and

a means for constructing said test environment for one of said logical partitions.

7. (original): A vendor computer system according to claim 5, further comprising:

a means for recording said software-updating patch in a patch database; and
a means for accepting a request to update said user computer system from said user computer system and retrieving a software-updating patch proper for said request to update said user computer system from said patch database.

8. (original): A vendor computer system according to claim 5, further comprising:

a means for recording information received from said user computer system as said information on said user computer system in a user computer system-information database; and

a means for retrieving said information on said user computer system from said user computer system-information database.

9. (currently amended): A user computer system receiving software from a vendor computer system, said user computer system comprising:

a means for transmitting information on said user computer system to said vendor computer system;

a means for receiving a software-updating patch from said vendor computer

system;

 a means for constructing a test environment based on the basis of a said
 software-updating patch received from said vendor computer system and said
 information on said user computer system;

 a means for evaluating said software-updating patch by using said test
 environment to give a result of evaluation; and

 a means for transmitting said result of evaluation to said vendor computer
 system.

10. (original): A user computer system according to claim 9, further
comprising:

 a means for logically dividing a real machine of said user computer system
 into a plurality of logical partitions; and

 a means for constructing said test environment for one of said logical
 partitions.

11. (new): A system-updating method according to claim 1, wherein said
software-updating patch includes a source-code patch.

12. (new): A system-updating method according to claim 1, wherein said
source-code patch is compiled.

13. (new): A system-updating method according to claim 1, wherein said
software-updating patch is supplied to said user computer system having said user
computer system information.

14. (new): A vendor computer system according to claim 5, wherein said software-updating patch includes a source-code patch.

15. (new): A vendor computer system according to claim 5, wherein said source-code patch is compiled.

16. (new): A vendor computer system according to claim 5, wherein said software-updating patch is supplied to said user computer system having said user computer system information.
